

Science is the most powerful generator of knowledge.
No one seems to doubt that scientists steadily reveal the
secrets of the world and human behaviour.

But what exactly is the scientific method?

Does science really offer insight into the nature of
the world and the interactions of humans?

Exploring humans examines how philosophers
struggled with these questions. This book highlights
their influence on thinking about social sciences
like economics, psychology and sociology.

By presenting cases and reassessing the traditions
of pragmatism and naturalism, it explores and defends
the idea that science indeed offers the best view
on humans and the world.
