

**W** hat is the future of science

and technology? Will academic research become a commodity like so much else? Will technology and science become ever more intertwined? Such questions concern anyone to whom science and technology matter. A philosophical approach can shed light on them, as Hans Radder has amply shown. This volume contains essays by colleagues and friends that highlight the wide variety of topics he has addressed in his work. Whether it is the interaction between science, technology and society, the nature of scientific experimentation, or the scientific realism question, Radder's approach is always acute and committed.
